Allowable Subject Matter

Applicant discloses a colorant comprising (i) iron oxide particles having a particular shape and dimensions treated with a combination of a polysiloxane and a polyhydric alcohol, and also (ii) an oxycarboxylic acid salt.

The most relevant prior art documents are, in the Examiner's estimation, Ayala et al., U.S. Patent # 4,798,856, Rademachers et al., U.S. Patent # 4,681,637, and Miyagawa et al., JP 2004-231609.

Ayala discloses a resin having dispersed therein pigments selected from those outlined in column 4, lines 15-27. Their treatment with a surfactant selected from those mentioned in column 4, lines 51-66. Both polydimethylsiloxane and trimethylolpropane are mentioned in that passage but there is no indication that it had been contemplated to use these different surfactants together. Moreover, it is not clear why the employment of alpha-iron oxide having the dimensions and shape demanded by the claims would have been obvious. Finally, although the Examiner had seen some evidence that it was known to use carboxylic acid salts as dispersants for oxidic materials, the aforementioned surfactants, themselves, are intended as dispersants thus the reasons why one would have been motivated to further add a carboxylic acid salt to this system is unclear.

Rademachers et al. disclose the employment of a combination of an organohydrogensiloxane and trimethylolpropane for the treatment of zinc ferrite. See column 3, lines 13-21. Although zinc ferrite is indeed a mineral containing iron, a

reason why this same treatment agent should be applied to alpha- iron oxide was lacking, particularly since this combination of dispersants has clearly not been widely used.

Miyagawa describes a polysiloxane compound having grafted thereon substituents that comprise a plurality of hydroxyl groups. See [0006-0016]. It is contemplated that this polymer may be used to treat granular materials [0005] of which iron oxide is one embodiment [0032]. This one product satisfies both the requirement for a polysiloxane and a dihydric alcohol. However, although it might even be established that the incorporation of an oxycarboxylic acid is obvious (though perhaps not as a dispersant) since the addition of this class of compounds to cosmetic formulations is widespread, the claims are allowable over this document at least for the reason that no details concerning the iron oxide, which represents only one of dozens of granular materials that may be modified at its surface with the aforementioned polysiloxane and reasons why an iron oxide type corresponding to that claimed would be chosen are unclear.

Insofar as these documents are regarded as the closest prior art and, yet, fail to even render obvious the instant invention, claims 1-32 are deemed allowable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably

accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
